

Solana Mobile · Clock In

Rise

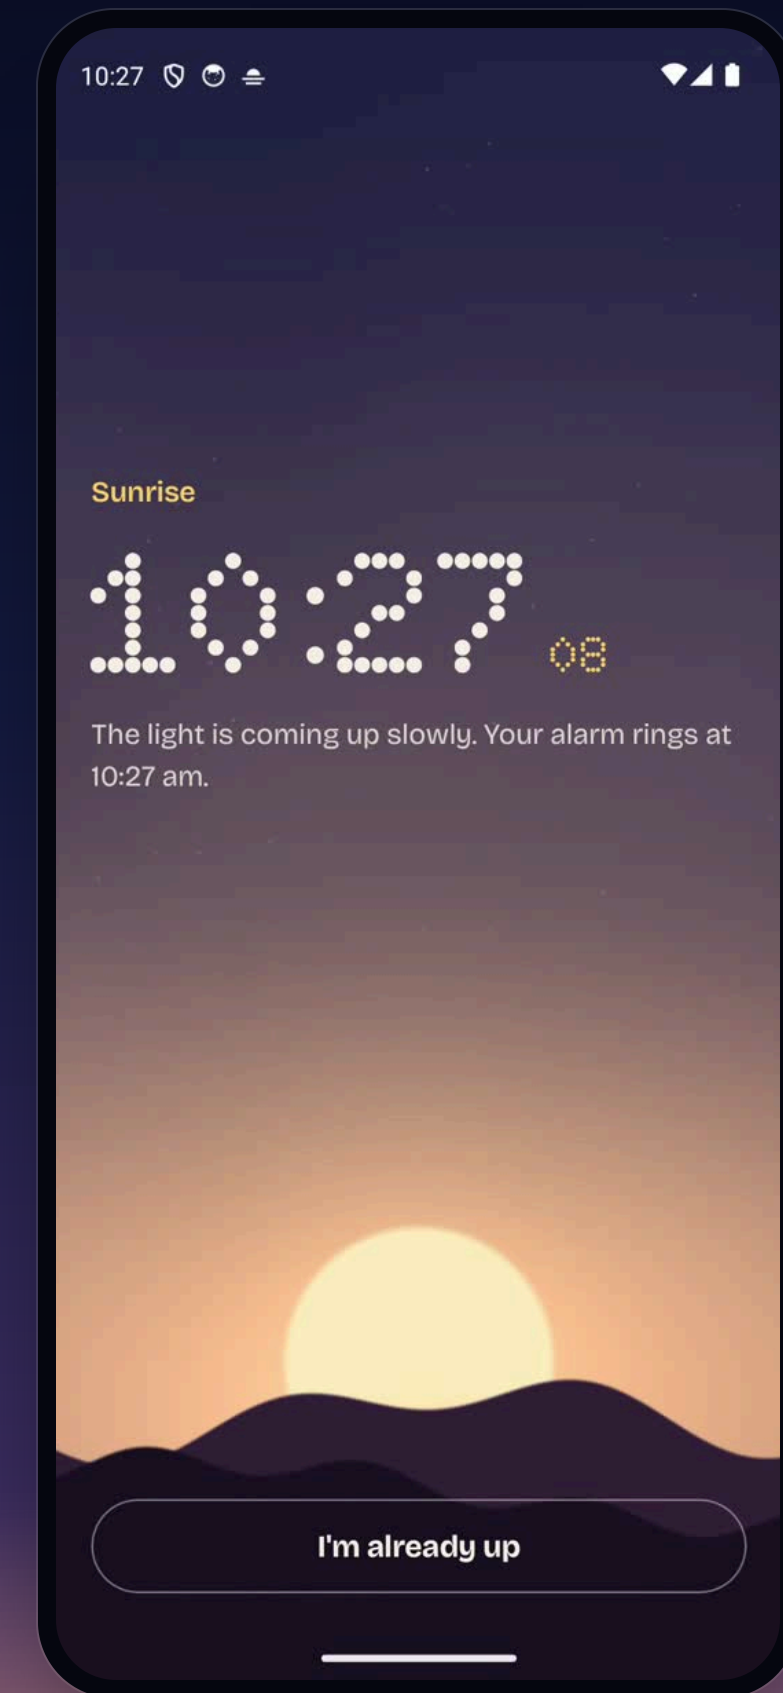

The alarm your friends are betting on.

The problem

Snooze wins because nothing is at stake.

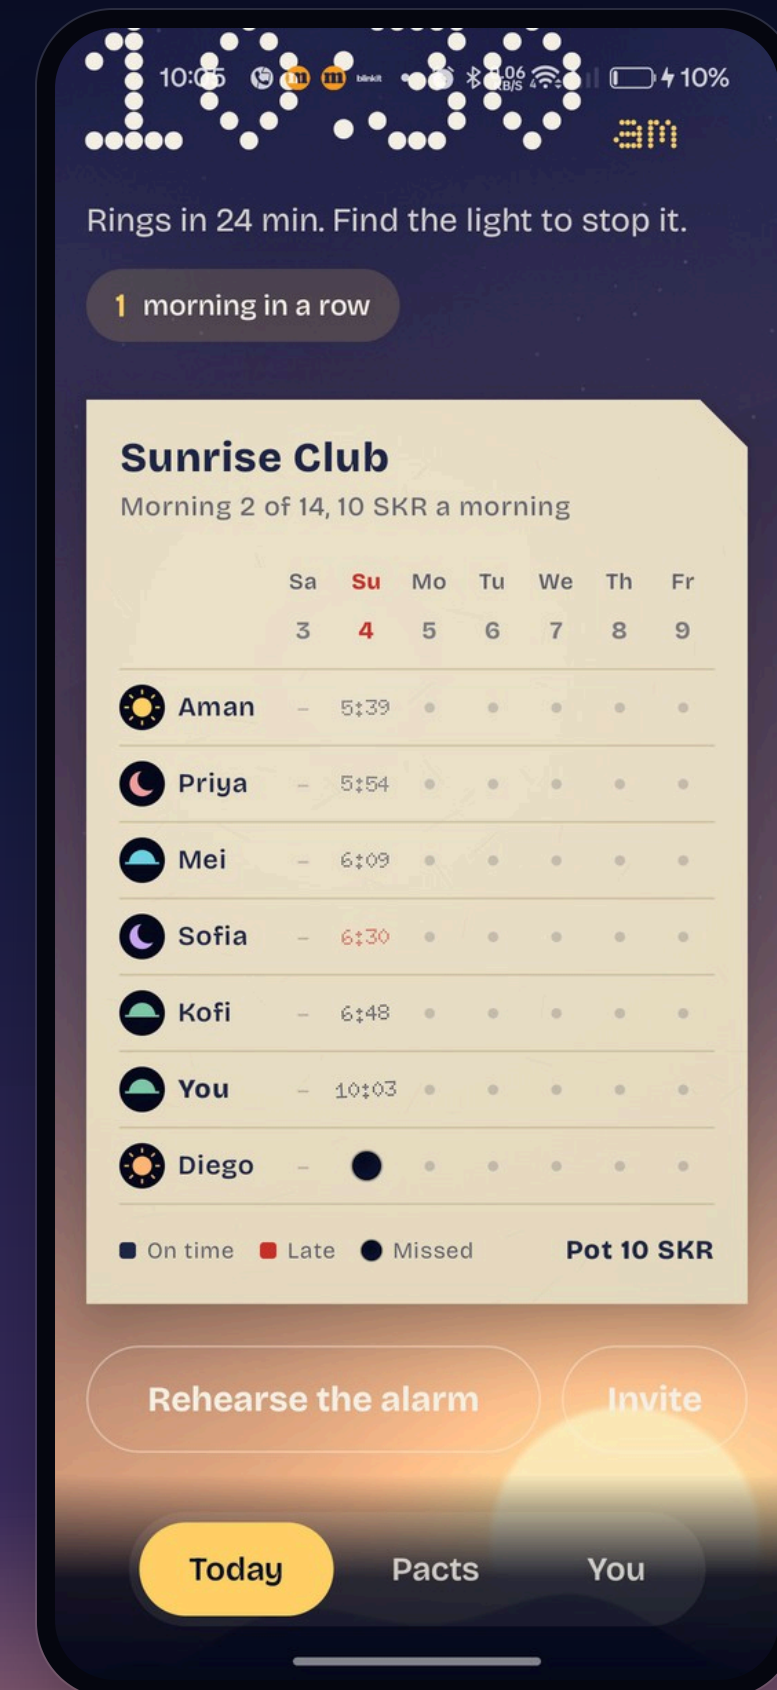

- Every alarm on your phone can be dismissed half asleep, in under a second.
- Habit apps run on willpower and streak badges. Mornings are when willpower is lowest.
- What actually gets people up: **someone waiting on them** and **something to lose**.

The idea

A pact with friends, paid in SKR, kept on Solana.

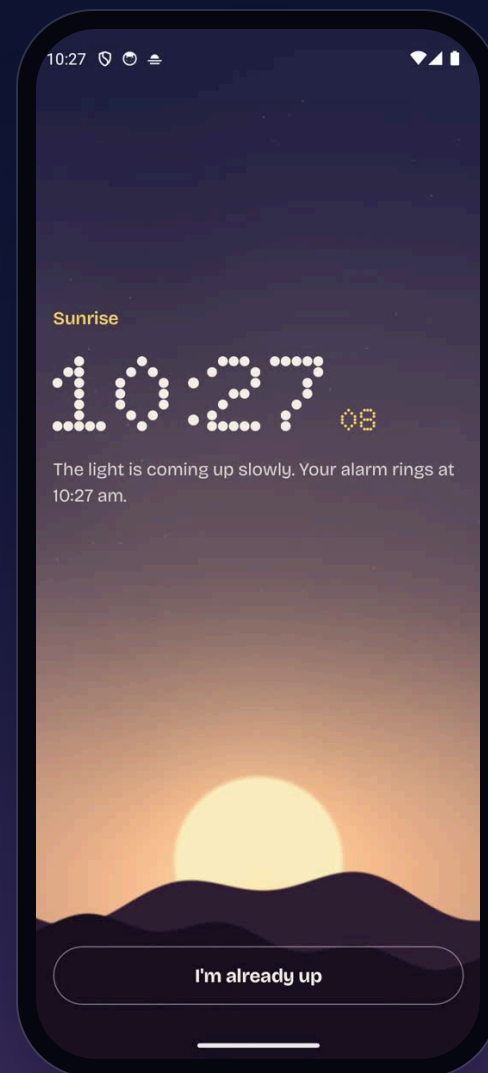

- **Make a pact.** Friends lock SKR for each morning and pick their wake times.
- **Clock in.** Finish a sensor mission and sign once. The program checks Solana's clock against your window.
- **Sleepers pay.** A missed morning stays in the pot, split by mornings kept when the pact ends.

Sunrise Club, live on devnet

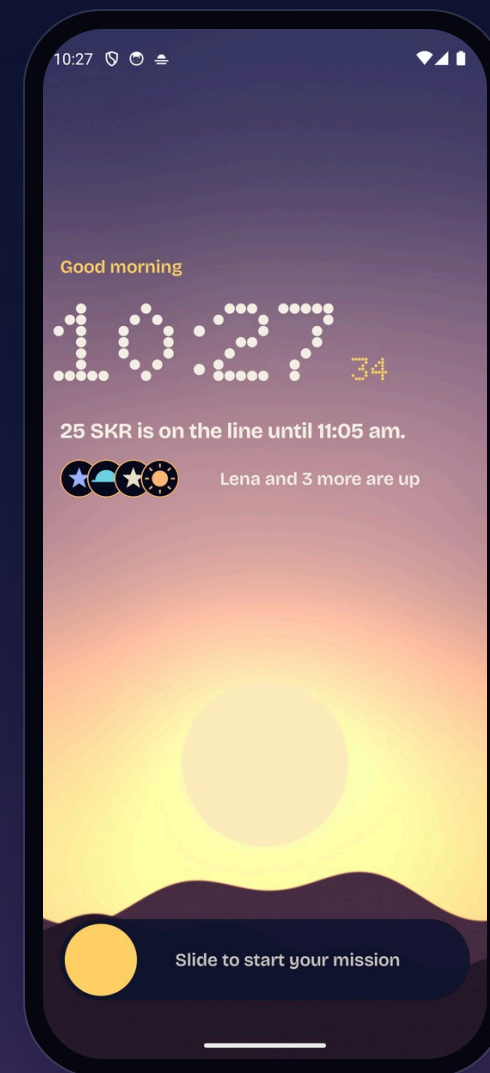

A morning with Rise

Sunrise, stakes, mission, stamp.

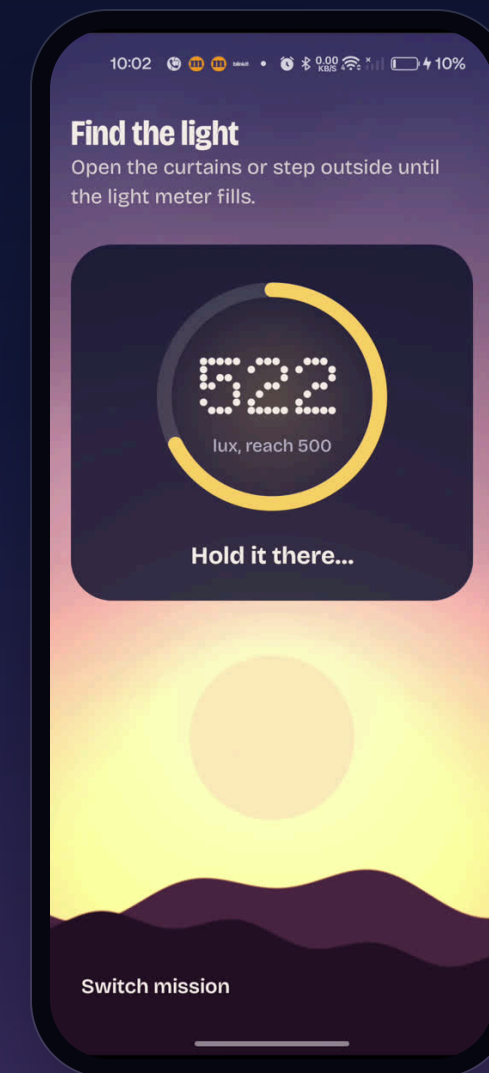

1 Sunrise

The lock screen warms like a sunrise lamp before the alarm.

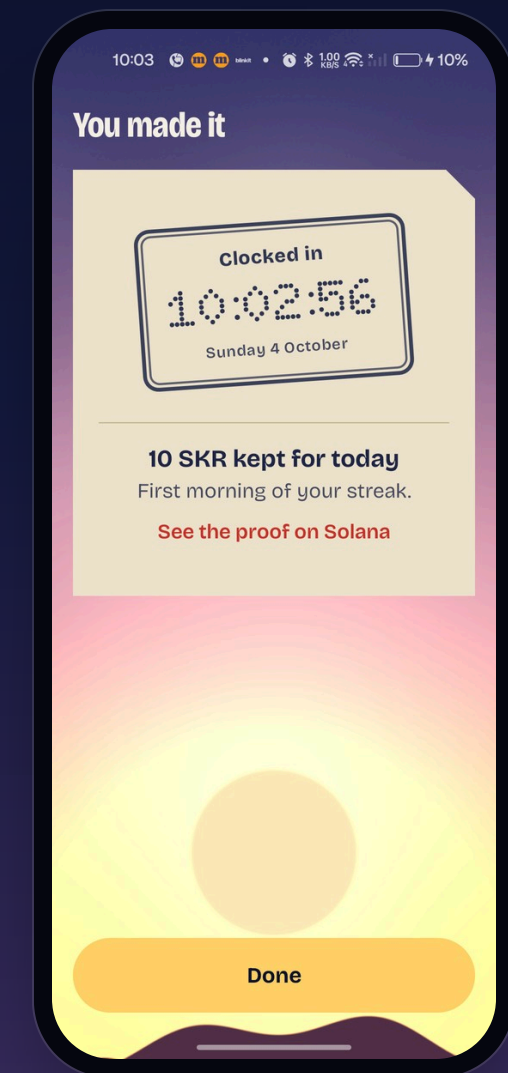

2 The stakes

The alarm says who's up and what's on the line, out loud.

3 Mission

Daylight on the light sensor, 30 steps, or a QR at your wake spot.

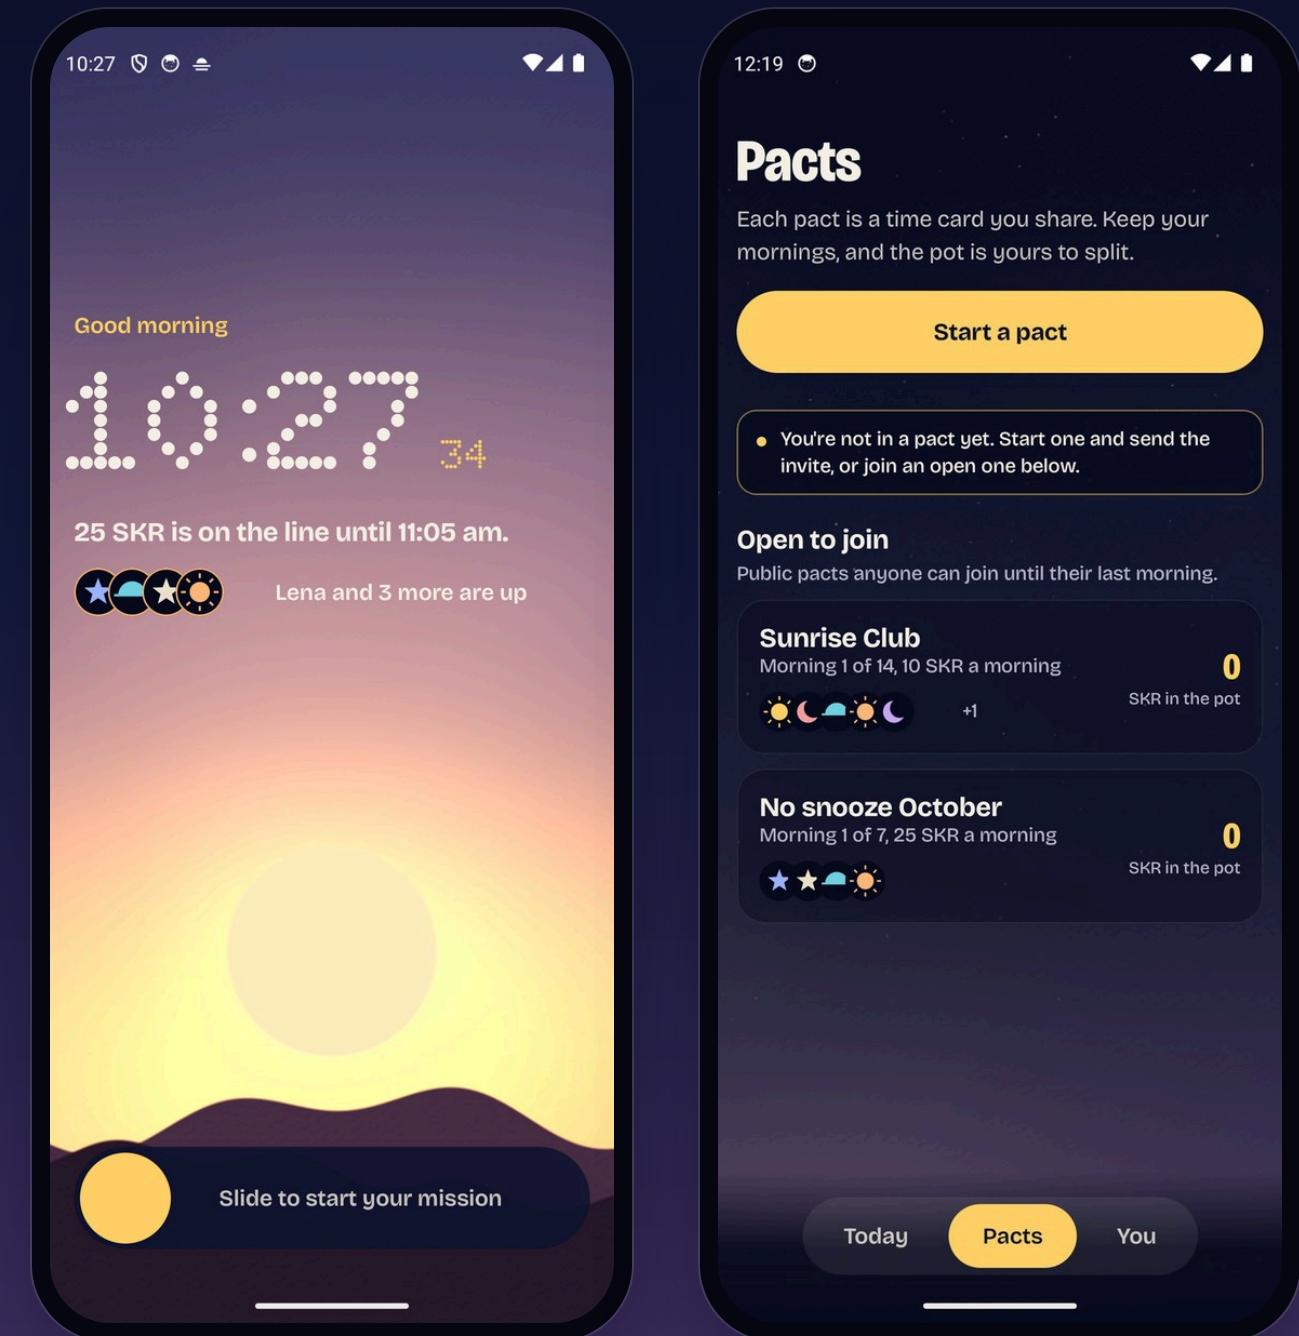

4 Clock in

Signed in your wallet and stamped on the pact's time card.

Stickiness

Opened every single morning, by design.

- **Daily by definition.** The core loop is the one thing everyone does every day: wake up.
- **Loss aversion, not badges.** Your own SKR is on the line, and you can watch the pot grow.
- **Social pull.** The time card shows who's up; the alarm tells you by name.
- **Pacts renew.** A 7- or 14-morning pact ends with a payout, and a reason to start the next one.

Built for Seeker

Only a phone can do this.

Mobile Wallet Adapter

Every pact action is signed through MWA: Seed Vault on Seeker, Phantom or Solflare elsewhere. Verified app identity via Digital Asset Links.

Seeker Genesis Token

Sign in with Solana, then the server checks the wallet for an SGT on mainnet (mint authority, metadata pointer, group). Verified Seekers get a badge.

Sensors as proof of waking

Ambient light sensor, step detector and the camera with on-device ML Kit QR scanning decide when the alarm stops.

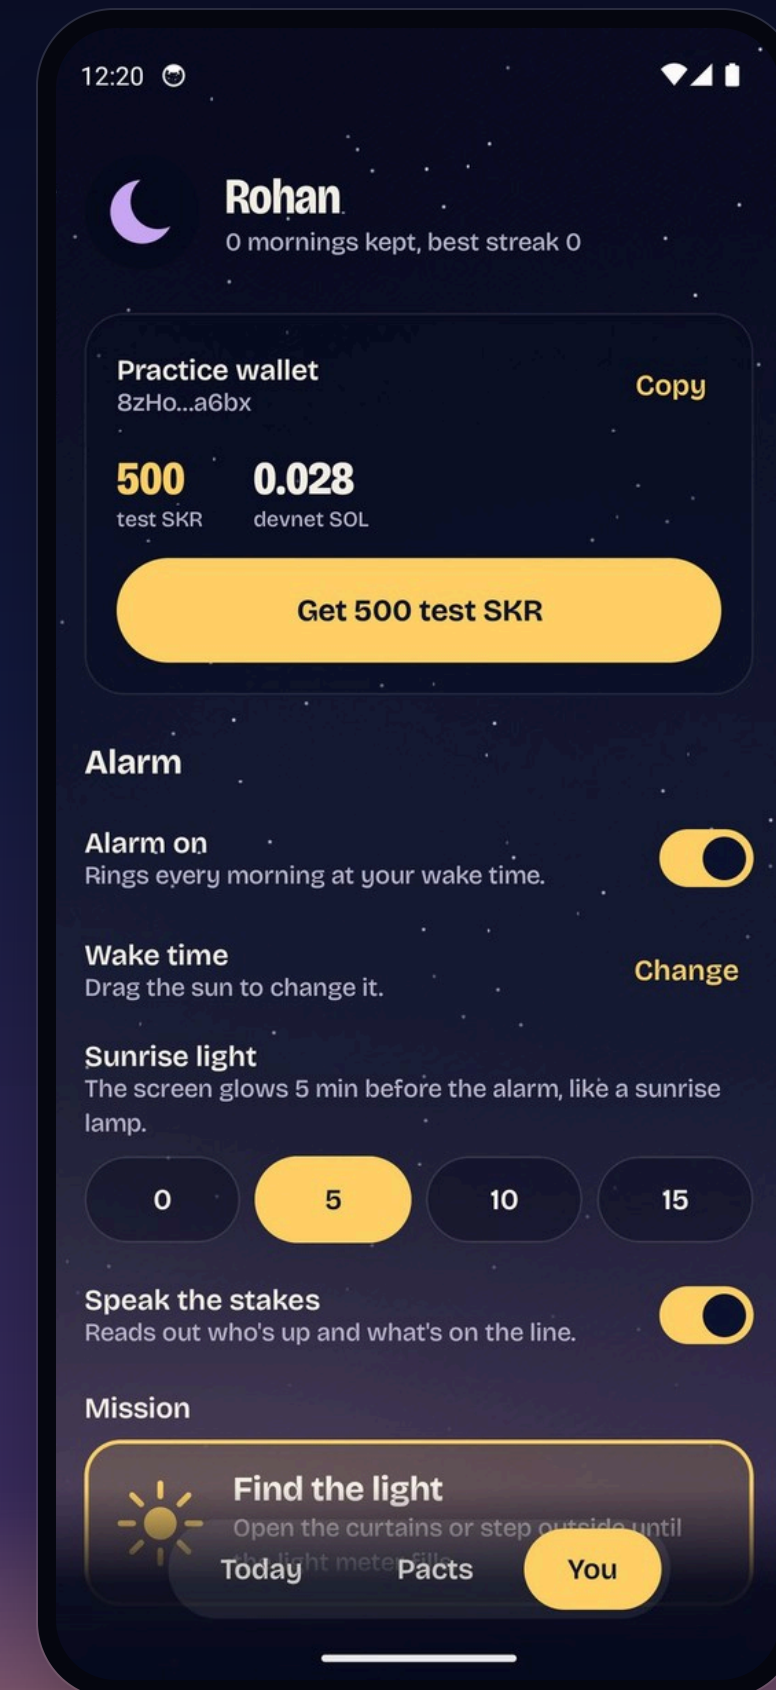

A real alarm clock

Exact alarms, lock-screen takeover, a climbing alarm tone, text-to-speech stakes, haptics. Native Kotlin and Jetpack Compose with an AGSL sky shader.

SKR integration

SKR moves between friends based on who gets up.

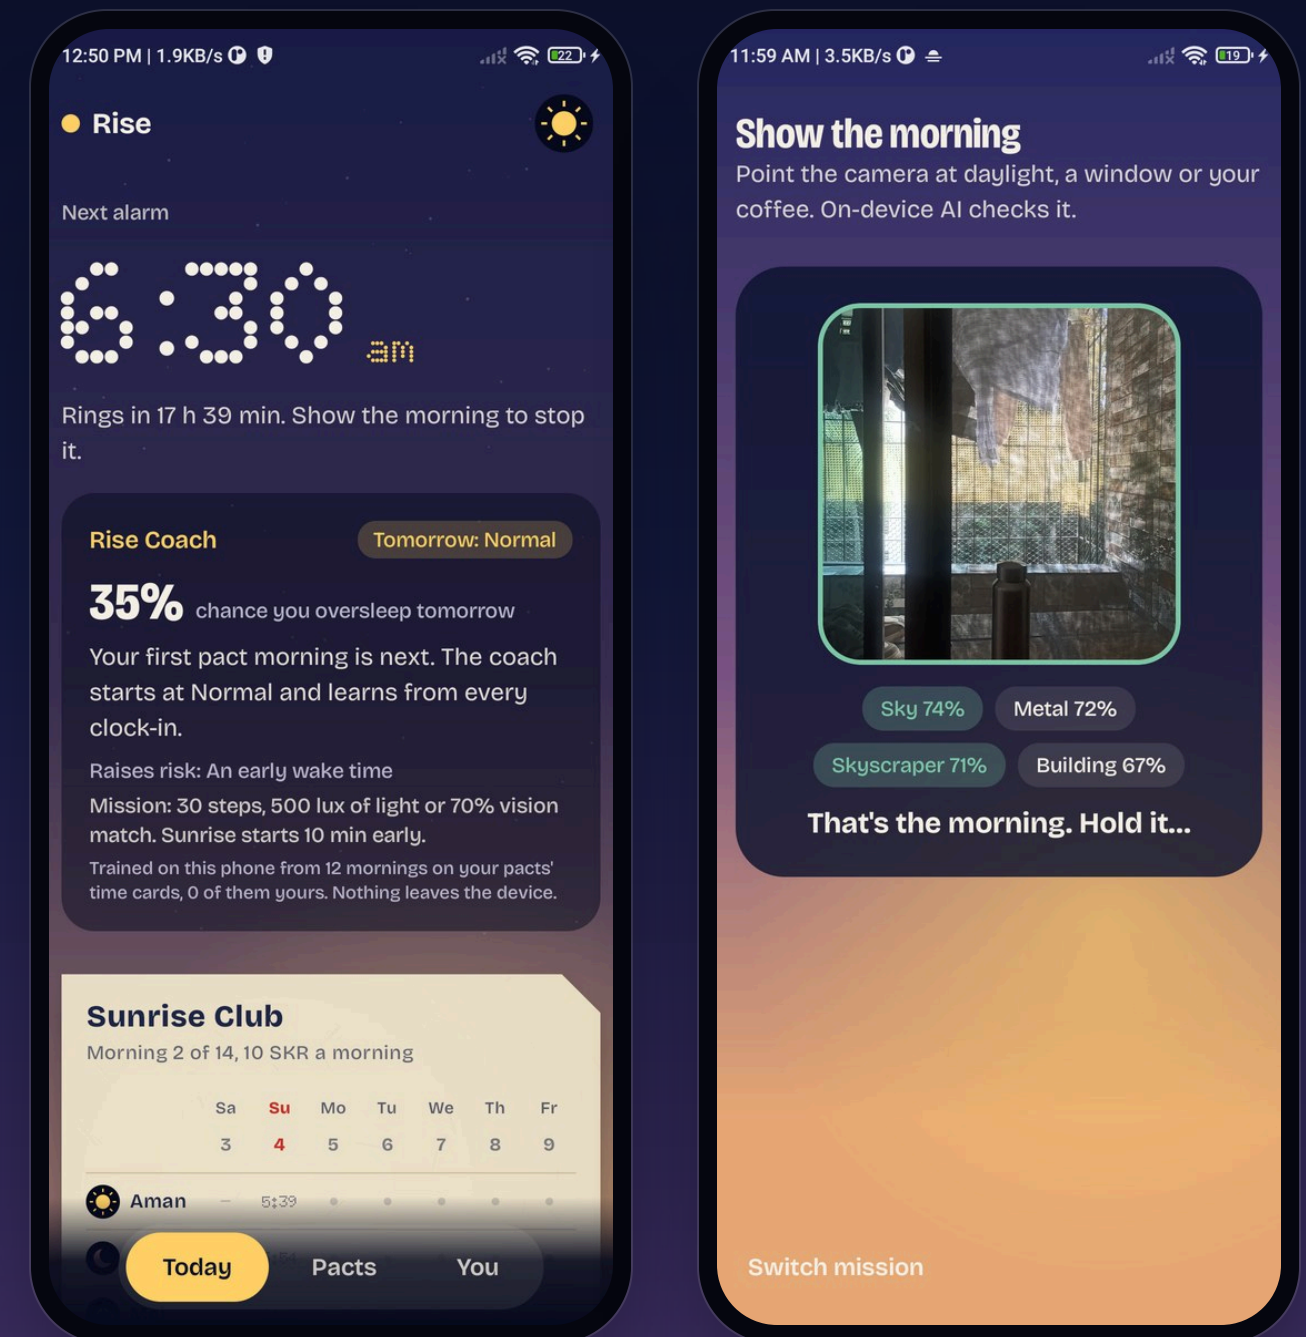

- **The stake and the reward.** Every pact is denominated in SKR. Kept mornings earn it back; missed ones pay the risers.
- **Not staking.** No lockups with validators. SKR circulates inside the Seeker community every morning.
- **Community pacts.** Public pacts like the "Sunrise Club" let any Seeker owner join, one seat per verified device.
- **Devnet today.** A Token-2022 test SKR with on-chain metadata, minted by the program's own faucet.

Rise AI, on the device

A coach that learns from real mornings.

- **Rise Coach.** A logistic-regression model trained on the phone from every member's mornings on your pacts' time cards, weighted to you. It predicts tomorrow's chance you oversleep and sets the mission: Gentle, Normal or Tough.
- **Show the morning.** ML Kit's on-device image labeler has to see daylight, a window or your coffee before the alarm stops.
- **Proof anomaly scoring.** Sensor traces that look injected or robotic score low, and the confidence is written on chain with the clock-in.

Architecture

Phone, wallet, chain, and a thin web layer.

Android app (Kotlin + Compose)

Alarm service

Exact alarms, sunrise lead-in, climbing tone, spoken stakes

Missions + Rise AI

Light, steps, QR, on-device vision; coach and proof scoring

Time cards + pacts

Reads pacts and members straight from devnet

transaction

Wallet

Mobile Wallet Adapter

Seed Vault on Seeker, Phantom, Solflare. Signs and sends. Verified via assetlinks.json.

signed

Solana devnet

Rise program

create_pact, join, clock_in, claim, drip. Windows on Clock.

Pact vaults

SKR in PDA-owned token accounts

Devnet SOL for fees

/api/seeker

SIWS + Genesis Token on mainnet

On-chain account model

Five accounts, six instructions, no withdraw key.

Account	Seeds	Holds
Pact	pact, creator, seed	Name, stake per morning, start, day length, mornings, grace, member count, total deposited, mornings kept, total paid
Member	member, pact, owner	Name, sign, wake offset, first morning, deposit, streaks, one clock-in record per morning (seconds from wake time)
Vault	ATA of the pact PDA	The locked SKR. Only claim moves it.
Faucet / DripTicket	faucet / drip, user	Test-SKR faucet (devnet), one drip per wallet per hour

create_pact Checks the settings, opens the vault	join Locks the stake for every remaining morning	clock_in Counts only inside your window on Solana's clock, once
claim After the last window: kept stakes plus your pot share	drip 500 test SKR, once an hour per wallet	init_faucet One-time setup of the devnet test-SKR faucet

On chain

An Anchor program with no admin key.

- **Windows on Solana's clock.** A clock-in counts from 30 minutes before your wake time until the grace period ends.
- **Vault per pact.** SKR sits in a PDA-owned token account. Nobody, including us, can move it.
- **Tested.** Bankrun tests move the clock through whole pacts; CI builds the program, the app and the site.

$\text{pot} = \text{deposits} - \text{stake} \times \text{mornings kept}$

$\text{payout} = \text{stake} \times \text{kept} + \text{pot} \times \text{kept} \div \text{all kept}$

Payouts always sum to what was locked. If nobody wakes up, everyone is refunded. Late joiners lock stakes only for the mornings left.

```
Program 6kQL7PccHpE7yUrsq5TgxFgQc7K7FVbUJShRUPbWfCdS  
Test SKR SKRxp6EbHDAzboW6GvwhL8ARH DU5pQLmtZEh7t4XX38
```

Settlement, proven on devnet

Every SKR locked is paid back out.

A real pact on devnet with 10-minute "mornings": 3 members lock 90 SKR.
Mornings kept: Aman 3, Priya 1, Mei 1 (one late, in red). The pot is 40 SKR.

+54

Aman: 30 kept + 24 from the pot

+18

Priya: 10 kept + 8 from the pot

+18

Mei: 10 kept + 8 from the pot

Vault after settlement: **0 SKR**. An early claim was rejected. A pact where nobody woke up refunded everyone in full. Every transaction is linked in [docs/SETTLEMENT.md](#).

Money and time on chain. Proof of waking on the phone.

Time manipulation

Windows are checked against Solana's Clock. The phone's clock is never used.

Replays and double clock-ins

One slot per member per morning (**AlreadyIn**); only the owner can sign for their member account.

Spoofed sensors, fake QR, photos of photos

Trace anomaly scoring, per-user random QR, vision thresholds; confidence recorded on chain and visible to the pact.

Faucet abuse and sybils

On-chain hourly drip limit; SOL API only tops up empty wallets; Seeker Genesis Token for one seat per device.

Live on devnet

Real mornings, real transactions.

10:02:56

Clocked in on a OnePlus 10T, signed in Phantom, finalized on devnet.

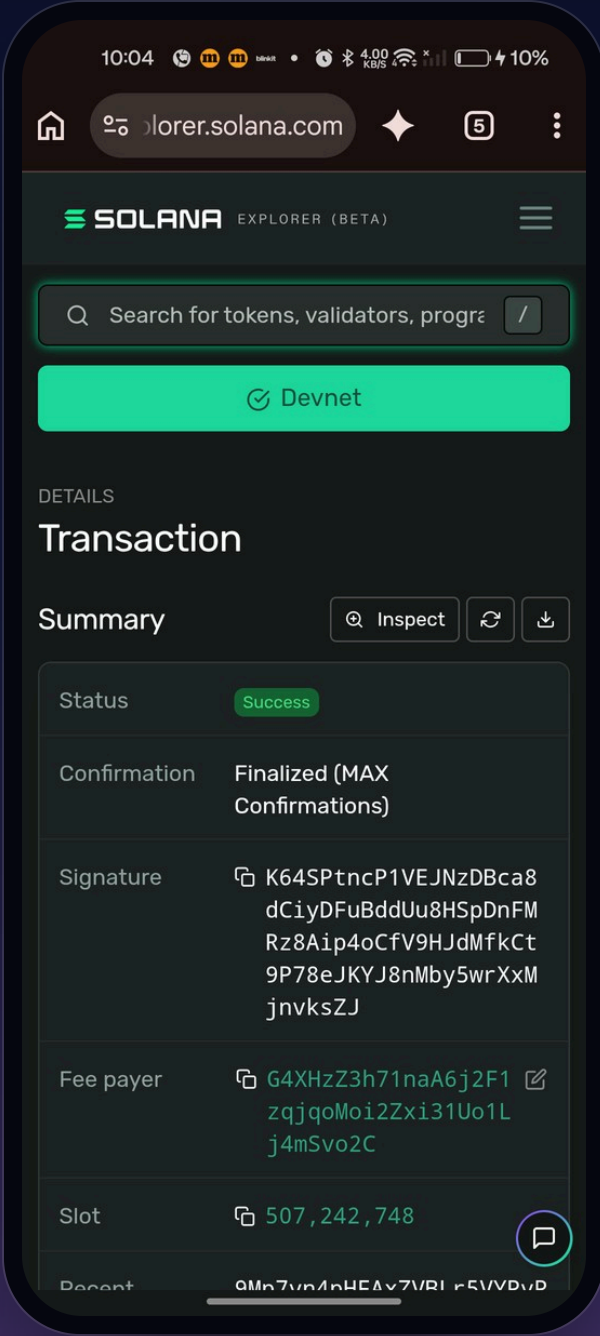

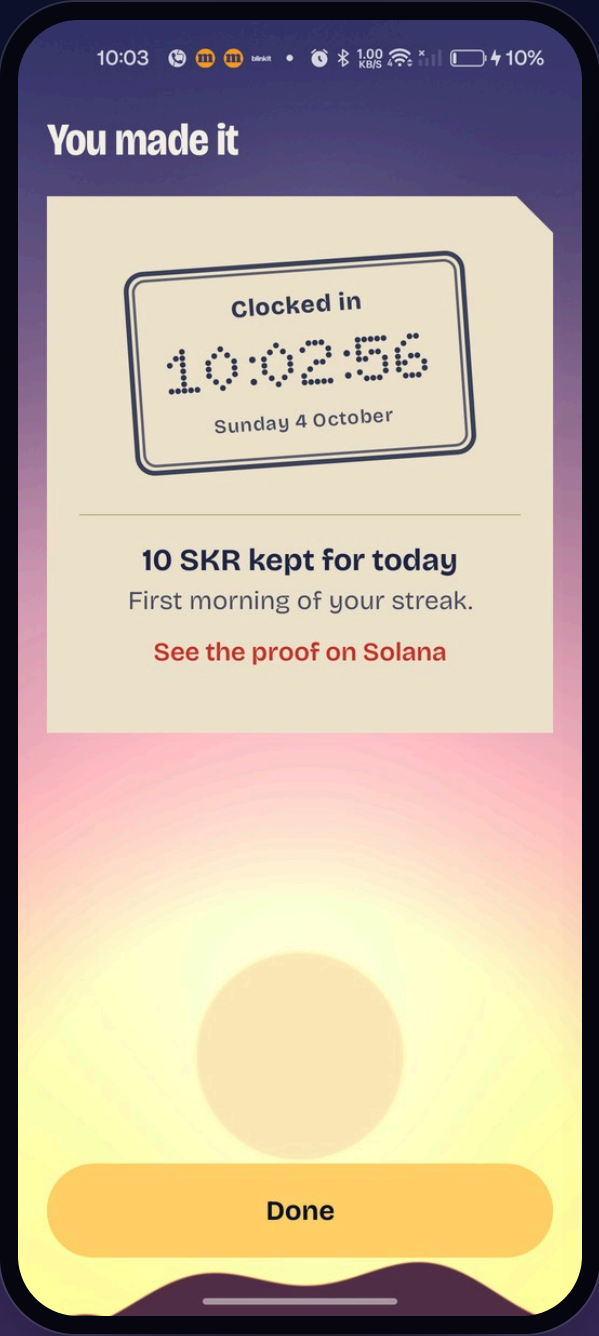

2

Public pacts with early risers clocking in every morning.

6/6

Program tests passing in CI, with app and site builds.

Next

From devnet to every Seeker's nightstand.

- **Mainnet with real SKR** and a Solana dApp Store release.
- **Seeker-only pacts**, one seat per Genesis Token, so community pacts stay fair.
- **Wake-up calls**: once you're up, ring a friend who's still asleep.
- **Streak collectibles** as compressed NFTs for kept months.
- **Harder missions** with on-device attestation so sensor proofs can't be faked.

Wake up. Clock in. Let the sleepers pay.
